About Me

I'm a full stack developer working mainly in **Typescript**, **Rust** and **Golang**. I also know **React** and **React Native**.

I assumed the role of tech leader multiple times, consistently delving into the coding details of our projects and actively leveraging my expertise to ensure their success.

In the last few years, I've gone back to being hands-on, joining the startup scene in companies like **Grantify**, **Tractable.ai** and **RelayTech**.

Before that, I worked for 8 years at **Vonage** (part of **Ericsson**), Developing the **Conversation API** which is a SAAS software used by several prominent software companies. More specifically is a REST API providing a multichannel real-time communication.

Working at the conversation API I've learned a lot about how to deal with microservices, distributed systems, real-time communication, multi master db's like **Couchbase** and the **WebRTC** standard.

I'm probably not the typical Full Stack Developer who just does "a bit of everything."

In almost 20 years of experience, I've founded my own startup and helped build some of the largest websites in the world — including MTA, Royal Mail, and Aetna.

Over the years, I've worked across the entire stack: from front-end projects like creating design systems and React SDKs for chat and calls, to deep back-end projects such as real-time SaaS APIs used by companies like Twitter, Telegram, and ByteDance.

I've also been on-call for over 14 years, supporting production systems and learning what it truly means to build reliable, scalable software. That's because, rather than chasing job titles or specific skills, I chase interesting people and challenging problems.

Over time, my fascination with **Rust** has deepened significantly. I've not only integrated it into our workplace but also actively contributed to the **WebRTC.rs** project.

I occasionally write about software-related topics in my tech blog, **Casual Programming**.

Skills

Javascript Typescript Node.js React React Native Rust AWS Remix.run Docker Kubernetes Distributed Systems Next.js REST API Design Expo WebRTC Couchbase Socket.io Golang Postgres

Experience

Fullstack Developer at **Grantify** - November 2025, Current

Designing, developing, and maintaining full-stack features for the funding platform using **TypeScript**, **React** and serverless architectures on AWS

Building backend services with AWS Lambda (TypeScript) and contributing to frontend development in React

Introducing **TurboRepo** into an existing Python/TypeScript monorepo to improve build performance and developer experience

Enhancing system observability by integrating **CloudWatch** and **Grafana** for monitoring and logging

Contributing to infrastructure and operations using **AWS CDK** (TypeScript)

Fullstack Developer at **Relaytech** - September 2025, November 2025

At Relaytech I've Designing, developing, and maintaining full-stack features for the e-commerce delivery platform using **TypeScript**, **Python**, **React**, and **Mantine**

Building and integrating RESTful APIs, managing business logic, and working with **Postgres**, **Redis**, and **Kafka** for data persistence, caching, and event-driven communication

Fullstack Developer at **Tractable.ai** - April 2025, September 2024

At Tractable.ai, I led the design and implementation of a reusable Design System for the company's three main products using **React**, **TypeScript**, **Tailwind**, **Radix UI**, and **Storybook**.

My role included setting up a CI/CD pipeline and deploying Storybook on Kubernetes, while closely collaborating with the design team to ensure alignment with the company's visual language.

I was also involved in 2 different projects, based on **React**, **Remix**, **Node.js**, **Postgres** and **Drizzle**. I also structured a **Turborepo** monorepo for streamlined code management.

Additionally, I contributed to the development of a new flagship product, handling both frontend and backend features and establishing a modular monorepo for unified app architecture.

Achievements:

- Designed and implemented a comprehensive Design System, working closely with design and product teams to ensure alignment with the company's visual language.
- Built a CI/CD pipeline for the Design System and Storybook, deploying Storybook on Kubernetes.
- Established a Turborepo monorepo for the Design System to optimize code management.
- Created a unified monorepo for the new app, integrating both frontend and backend code in a modular monolith structure.
- Led the development and coordination of an entire section for the company's new flagship product.

Tech Leader at **Vonage** (part of **Ericsson**) - January 2018, January 2024

I was promoted to Technical Team Leader to lead the team behind the **Conversation API** and the **Clients SDKs** (JS | Android | iOS).

As a team leader, I spearheaded the design and execution of real-time communication solutions, scaled mission-critical databases, and designed REST APIs and SDKs, all within the context of a SAAS platform serving prominent software companies.

Given the unique nature of our business and customer base (our clients are developers), business decisions are intricately intertwined with architectural decisions and vice versa.

This required me to work very closely with the product team and be a key contributor to the tech strategy and business direction of the project.

This role demanded close collaboration with various teams, including SRE (Site Reliability Engineering), Devrel (Developer Relations), Tech Support, and Presales.

As a team leader, I often extended my collaboration to working directly with our customers' development teams, pairing up to help them design and optimize their solutions. I Worked in a cross-functional team of 40 engineers, directly leading 10 of them, working across the full SDLC.

I also Worked in an highly flexible Agile Kanban process, with a strong focus on continuous delivery and continuous improvement.

Personal achievement:

- Designed and led the implementation of integrating the IM channels (SMS, Facebook, Whatsapp) with the Conversation API.
- Designed and led the implementation of increasing the allowed participants in a conversation from 20 to 3000.
- Fixed security vulnerabilities on both our Docker images and our Node.js code.
- Designed and led the implementation of the React SDK.
- Personally implemented several example application of how to use the Conversation API, using React, Next.js, Docker and Fly.io.
- Participate in the Design and effort of the system migration from Cloudflare to AWS and Nomad/Kubernetes.
- Designed and implemented metrics and kibana dashboard used to monitor the api in order to reduce MTTR and MTTR during incidents.
- Designed and led the implementation of the new Cross Platform SDK (JS | Android | iOS). Using a flux architecture.
- Designed and led the implementation of Cross Platform SDK Testing Strategy.

Node.js API developer at **Nexmo** (a **Vonage** company) - November 2016, December 2017

I was Hired as a Node.js developer to work on the **Conversation API** And the **Javascript Client SDK**. The api was a POC with some onboarded customers, I was the first senior developer working on it, and I was responsible for scaling the api.

Personal achievement:

- introduced test driven development in the team. I wrote the first test and I lead the effort of moving the code coverage from 0 to 80%.
- implemented the in-app voice feature on the backend. working very closely with the client SDK team and the voice experts.
- implemented the design and lead the effort of reducing the response time of the api from 1.5s to 300ms.

Senior Front End Developer at **Workdigital** (a **DHI** company) - November 2014, November 2016

I was Hired as Senior Frontend developer at Workdigital, a fast-growing start up based in London.

Personal achievement:

- I've introduced **React** in the company, Implementing from scratch An internal portal.
- I've designed and Implementing E2E tests inside the company using **Nightwatch.js**.

Fullstack Developer as Freelancer - January 2014, October 2014

I built a geolocated chat called CityClub.tv as a JavaScript full-stack developer using NodeJS, socket.io, and AngularJS.

Team Leader at **Usablenet** - August 2010, May 2012

As a team leader, I balanced the workload of a team of developers. Despite this, I carried out the normal duties of a coder, developing web interfaces for mobile devices using JavaScript, CSS, XHTML, HTML5, and XML, paying particular attention to browser interoperability. I also developed REST APIs using proprietary tools.

Web Developer at **Usablenet** - May 2012, October 2014

As a mobile web developer, I deployed mobile websites for big brands such as Aetna and Carmax using a proprietary platform based on XSLT and JavaScript.

Software Engineer at **Digitalapes** - May 2012, October 2014

I co-founded Digitalapes, a startup company dedicated to the development of a mobile geo-localized community for smart-phone users. My main responsibilities were the design and the development of websites using **GTW framework**, executing smoke tests and writing **cross-compiling for GCC compiler** guides.

Python Web Developer as Contractor at **University of Udine** - July 2006, August 2006

For my bachelor thesis I've helped to deploy an e-government portal developed by the University of Udine for some little town on Friuli Venezia Giulia. After this, I've worked a little bit as contractor in order to fix bugs and fulfil change requests in the post sale phase. Technologies involved in this project were Plone and **Zope**

Projects I've Contributed To

Conversation API

The Conversation API enables you to build conversation features where communication can take place across multiple mediums including IP Messaging, PSTN Voice, SMS and WebRTC Audio and Video.

Javascript | **Node.js** | **Couchbase** | **Socket.io** | **Distributed Systems** | **WebRTC**

Client SDK JS

Vonage Client SDK allows you to build Programmable Conversation applications.

Typescript | **Socket.io** | **WebRTC**

A Contact Center example app

An example of how to implement a very simple contact center. Customer would interact with it via SMS or facebook page, agents would respond using the browser

Typescript | **Node.js** | **Next.js** | **TurboRepo**

A Multichannel chat app

A DIY slack like app, where you can use inapp voice, pstn voice, chat, facebook message, whatsapp and sms. You can also "talk" with openai

Typescript | **Node.js** | **Next.js** | **TurboRepo** | **Google ASR** | **Google TTS** | **OpenAI API** | **Fly.io**

Conversation API React SDK (experimental)

An experimental Conversation API React SDK. It's a set of React widget and tools that allows customers to quickly Integrate chat and voice in their applications.

Typescript | **React**

Cadoo

Cadoo was a game we did in 48 hours of straight code at the **Nordic Game Jam 2014**

Javascript

Education

Bachelor's degree in Computer Science, Web Information Technologies at **Università degli Studi di Udine** - 2002, 2006

I studied Computer Science, the curriculum I chose was Web Information Technology. My thesis made me implement a web e-government portal using **Python**, **Plone** and **Zope**
